Phase-transfer catalysis and related methods have emerged as preparative tools of prime importance. As techniques of conducting reactions in a multi-phase system, these methods have been applied successfully to a wide range of organic reactions.

The prime goal of the **Fluka Compendium** on **Phase-Transfer Reactions** is to provide the synthetic chemist with a quick access to the field of phase-transfer reactions through a comprehensive abstraction of the relevant preparative literature.

Volume 1 covered the literature to the end of 1978, and depicted more than 1500 reaction equations and contained a bibliographic list of 24 reviews and monographs as well as 887 literature citations.
The impact of phase-transfer catalysis on modern chemistry is far from subsiding. On the contrary, since 1978 numerous novel reactions have been discovered. Diverse new and appealing applications of the PTC-technique have been introduced, especially in the chemistry of polymeric compounds.

Volume 2 covers the years 1979–1983. This new volume includes about 5200 reaction equations on over 1000 pages and lists 1731 literature references and 48 review articles.

"The scope of the Fluka Compendium therefore makes it the prime source of information on phase-transfer reactions and related methods throughout the literature."

Organic Polymers

Synthetic polymers are one of chemistry's most significant contributions to the development of our modern technological society. Recently, basic research on polymers has gained increasing focus as exciting new applications have emerged in the electronic and biomedical fields. Despite their indisputable important, polymers have received relatively little attention in the research literature. Therefore, the three-volume **Houben-Weyl Supplement E 20** on organic polymers constitutes an invaluable and timely contribution. The Houben-Weyl Polymer Supplement presents a comprehensive coverage of all preparative work published in the polymer field since 1962, when the 4th edition Houben-Weyl Polymer Volumes XIV/1 and 2 appeared.

Practically half of the material evaluated and many of the numerous experimental procedures comes from the patent literature, thus making a large body of knowledge readily available to the research chemist for the first time in a comprehensive form.

Considerable progress has been made in the preparation of polymers in recent years. Accordingly, **Volume 1** covers the processes employed in the production of polymers, with special attention to reaction conditions and the structures of the polymers produced. Polymerization initiators are also presented, as well as the basic principles of polymer reactions. Finally, multiple-phase polymers (IPN, SIN, foams, etc.) are treated.

Volume 2 covers homo-, co-, block-, and blockcopolymerizations, as well as polycondensations of the specific monomers, including those that undergo metathesis. First, those monomers are discussed that form polymer chains containing only carbon atoms, then those forming chains containing carbon and heteroatoms (O, S, N, P, B, Si etc.).

Volume 3 begins with a coverage of synthetic resins based on amines, aldehydes and ketones (including epoxy resins). Then the preparation of chemically modified polymers is given thorough treatment, whereby cross-linking plays an important role. In this context, reactions on polysaccharides and their derivatives are also covered. A major section of Volume 3 is dedicated to special polymers, as a rules those with condensed or heterocyclic rings. Liquid crystals, chiral polymers and polymers in which the chain contains only, or principally, heteroatoms are dealt with here. A systematic treatment of the characterization of polymers by chemical, physical and spectroscopic methods is then presented. Furthermore, the toxicology and ecological behavior of polymers is covered, including that of the corresponding monomers. An extensive bibliography directs the reader to further material on the specific classes of polymers.

The **Houben-Weyl Supplement E 20** is a major work and constitutes an indispensable resource for scientists working in the polymer field.

Thanks to the clear organization and the numerous equations and formulae, the German text is easily understood by chemists of any tongue.
